TITLE: Orthobaric density and critical parameters of niobium and tantalum pentachlorides.

SOURCE: Zhurnal neorganicheskoy khimii, v. 9, no. 5, 1964, 1049-1052

TOPIC TAGS: niobium pentachloride, tantalum pentachloride, orthobaric density, critical parameter, critical density, critical pressure, critical temperature, niobium tantalum analysis, density temperature relationship, Berthelot equation, liquid vapor phase equilibrium, crystal liquid phase equilibrium

ABSTRACT: The orthobaric density of  $\text{NbCl}_5$  and  $\text{TaCl}_5$  throughout the liquid state and in the vapor state, and their critical parameters were determined (fig. 1). The densities of the liquid  $\text{TaCl}_5$  and  $\text{NbCl}_5$  and of their mixtures were measured precisely from their melting temperatures (216.2 and 204.2 C, respectively) to 300-320 C. The critical parameters for  $\text{NbCl}_5$  were: critical temperature 534 C, density  $\rho_{\text{crit}} 0.68 \text{ gm/cm}^3$ , pressure  $P_{\text{crit}} 46$  atmospheres; for  $\text{TaCl}_5$  were: 494 C, 0.89  $\text{gm/cm}^3$  and 43 atmospheres. Since the liquid-vapor phase and the crystal-

TITLE: Orthobaric density, critical parameters, and viscosity of  $\text{MoCl}_5$  and  $\text{WCl}_6$

SOURCE: Zhurnal neorganicheskoy khimii, v. 10, no. 1, 1965, 18-21

TOPIC TAGS: molybdenum pentachloride, tungsten hexachloride, orthobaric density, density, viscosity, melting point, pressure, critical temperature

ABSTRACT: This study of  $\text{MoCl}_5$  and  $\text{WCl}_6$  was carried out in order to determine the thermophysical properties of the compounds in the liquid and vaporous state, inasmuch as this knowledge is necessary for developing processes for the manufacture, separation, and reduction of higher molybdenum and tungsten chlorides. The purest fractions obtained after chlorination and purification of the molybdenum and tungsten chlorides were used for the investigation. The orthobaric density was determined for the entire temperature range of the liquid state. The density at temperatures ranging from the melting point to 400--440C was obtained with the greatest accuracy by the method of least squares and is represented by formulas. The critical parameters were determined from orthobaric density data. The viscosity was deter-

mined at temperatures ranging from the melting point to 310--400C and the results are described by formulas. More exact melting points of pure MoCl and WCl were determined to be at 194.4C and 283C, respectively. Experimental results are given in tables 1, 2, and 3 of the Enclosure. The data given in this study are new and do not appear in the technical literature. Orig. art. has: 2 figures and 3 tables.

TITLE: Critical parameters of phosphorus, arsenic, and antimony trichlorides

SOURCE: Zhurnal neorganicheskoy khimii, v. 10, no. 3, 1965, 592-595

TOPIC TAGS: <sup>21</sup>antimony trichloride, <sup>21</sup>arsenic trichloride, <sup>21</sup>phosphorus trichloride, <sup>21</sup>critical temperature, critical density, orthobaric density

ABSTRACT: This study has been carried out because the available data on the subject are disconnected and incomplete. Orthobaric density curves for  $\text{SbCl}_3$ ,  $\text{AsCl}_3$ , and  $\text{PCl}_3$  are plotted, and the critical temperatures and densities of the chlorides are determined from the density data. The experimental data are processed by the method of least squares and presented in the form of interpolated equations. Densities of the  $\text{SbCl}_3$  liquid from melting point to  $320^\circ\text{C}$  and of the  $\text{AsCl}_3$  and  $\text{PCl}_3$  liquids from  $0$  to  $120$ - $140^\circ\text{C}$  are measured with great accuracy. The results are given in Table 1 of the Enclosure. The experimental density results are, as a rule, in very good agreement with available data in the technical literature. The critical temperatures for  $\text{SbCl}_3$  and  $\text{PCl}_3$  are also in good agreement with the available data,

TITLE: Density, viscosity, and surface tension of silicon tetrachloride and trichloro-  
silane 41

SOURCE: Zhurnal neorganicheskoy khimii, v. 10, no. 6, 1965, 1297-1299

TOPIC TAGS: silicon tetrachloride, trichlorosilane, chloride density, chloride viscosity, chloride surface tension

ABSTRACT: The article continues a series of studies on the thermophysical properties of halides. Silicon tetrachloride and trichlorosilane are important source materials for the preparation of high-purity silicon. Data on their properties as reported in the literature are contradictory. In this report, the authors present the results of measurements of the density, viscosity, and surface tension of  $\text{SiCl}_4$  and  $\text{SiHCl}_3$  between zero C and a temperature slightly above their normal boiling points. The chlorides studied were thoroughly purified by chemical means and by distillation. Density was measured in quartz pycnometers, viscosity in a capillary viscometer, and surface tension by the method of maximum pressure in a bubble. All the measurements were carried out in sealed devices in order

TITLE: Density, viscosity, and surface tension of aluminum and gallium trichloride

SOURCE: Zhurnal neorganicheskoy khimii, v. 10, no. 7, 1965, 1516-1519

TOPIC TAGS: aluminum chloride, gallium chloride, density, viscosity, surface tension

ABSTRACT: Pycnometric measurements of density yielded the following equations:  
 $\rho_{Al_2Cl_6} = 1.2841 - 2.32 \times 10^{-3} \Delta t - 2.36 \times 10^{-6} \Delta t^2$  g/cm<sup>3</sup> from  $t_{fus} = 192.5$   
 to 256.0C, where  $\Delta t = t - 192.5C$  (mean square error  $\Delta \rho_{sq} = 0.0006$ ), and  
 $\rho_{Ga_2Cl_6} = 2.0546 - 1.985 \times 10^{-3} \Delta t - 1.44 \times 10^{-6} \Delta t^2$  g/cm<sup>3</sup> from  $t_{fus} =$   
 78.0 to 240.0C, where  $\Delta t = t - 78.0C$  (mean square error  $\Delta \rho_{sq} = 0.0013$ ).  
 From the peaks of orthobaric curves, the critical temperatures ( $t_{cr}$ ) were found;  
 the critical densities were also determined. From viscometric data, the following  
 equations were derived:

Card 1/2

L 62589-65

ACCESSION NR: AP5018241

$\eta_{Al_2Cl_6} = 3.602 \times 10^{-1} - 2.899 \times 10^{-3} \Delta t + 1.232 \times 10^{-5} \Delta t^2$  poise from  $t_{fus} = 192.5$  to  $276.0C$ , where  $\Delta t = t - 192.5C$  (mean square error  $\Delta \eta_{sq} = 0.002$ ), and

$\eta_{Ga_2Cl_6} = 1.768 - 2.22 \times 10^{-2} \Delta t + 1.47 \times 10^{-4} \Delta t^2 - 3.74 \times 10^{-7} \Delta t^3$  poise from  $t_{fus} = 78.0$  to  $247.0C$ , where  $\Delta t = t - 78.0$  (mean square error  $\Delta \eta_{sq} = 0.013$ ). The data obtained for the surface tension can be represented by the following equations:

$\sigma_{Al_2Cl_6} = 9.77 - 7.33 \times 10^{-2} \Delta t$  dyne/cm from  $t_{fus} = 192.5$  to  $285C$ , where  $\Delta t = t - 192.5C$  (mean square error  $\Delta \sigma_{sq} = 0.1$ ), and

$\sigma_{Ga_2Cl_6} = 25.9 - 1.0 \times 10^{-1} \Delta t + 8.7 \times 10^{-5} \Delta t^2$  dyne/cm from  $t_{fus} = 78.0$  to  $300.0C$ , where  $\Delta t = t - 78.0C$  (mean square error  $\Delta \sigma_{sq} = 0.3$ ). Orig. art. has: 3 figures, 6 formulas and 4 tables.

TITLE: Properties of liquid zirconium tetrachloride ~7

SOURCE: Zhurnal fizicheskoy khimii, v. 39, no. 12, 1965, 3025-3032

TOPIC TAGS: zirconium compound, chloride, heat of vaporization, *SURFACE TENSION*

ABSTRACT: The zirconium tetrachloride used was the purest fraction, purified by rectification in a metallic packed column. The content of hafnium and other metallic impurities in the chloride was less than a hundredth of a percent. The temperature measurements were calibrated on zinc (m.p. 419.5°C) and were made with a Chromel-Alumel thermocouple using a type R2/1 semiautomatic potentiometer. Determination was first made of the temperature of the triple point; this was done from the cooling curve. Next, measurements were made of the pressure of the saturated vapors. Results are exhibited in tabular form. Measurements of the viscosity were made with a special viscometer (illustrated in the

L 25850-66

ACC NR: AP6014898

article). Finally, the surface tension was measured, and the results given in a table. Calculations were made of the critical pressure, the quasinormal boiling point, and the dependence of the heat of vaporization on the temperature.. Orig. art. has: 10 formules, 4 figures and 3 tables.

**PURPOSE:** This collection of articles is intended for petroleum researchers, engineers, and refineries.

COVERAGE, a collection of articles dealing with the production and refining of petroleum. Individual articles discuss the effect of bound water on the depletion of petroleum deposits under dissolved gas conditions, the effect of pressure on the viscosity of degassed petroleum, the structure of high-molecular petroleum hydrocarbons, the asphaltene and carotene contents of paraffinic crudes and emulsion stability of hydro-aliphatic compounds, the effect of a product of synthetic hydrocarbon oxidation on the product of synthetical organic hydrocarbons, the production of flotation agents with the use of oxidized petroleum, and the investigation of air-adsorbed aromatic and naphthalene hydrocarbons by means of infrared absorption spectra. The remaining articles are on the relations of pressure-volume-temperature-ethylene and on the phase equilibria of the ethylene-hexane, ethylene-cyclohexane, and ethylene-1,3-butadiene systems. Specific volumes and compression coefficients at

<p>Preparation of sulfides of phosphorus from ferrophosphorus. V. V. Il'yarionov, T. I. Sokolova, and S. I. Vol'kovich. <i>Bull. acad. sci. U.R.S.S., Classe sci. chim.</i> 1945, 94-108 (English summary).—Heating 5.25 parts P (as ferrophosphorus) with 41.38 parts S (as pyrite) under <math>\text{CO}_2</math> for 5 hrs. gave 17.2% recovery of P as mixed sulfides at 700° and 87% at 1070°. The most economical procedure was to heat 5 hrs. at 900°, measure P in the residue, add pyrite stoichiometrically to the residue according to <math>15\text{FeS}_2 + 4\text{Fe}_2\text{P} = 23\text{FeS} + \text{P}_2\text{S}_5</math>, and repeat the heating. This gives 90.3% overall recovery of P as mixed sulfides, whose compn. can be adjusted by adding P or S. For conversion of 1 kg. P to <math>\text{P}_2\text{S}_5</math>, when pyrite is used, <math>\Delta H = 177 \text{ kg.-cal.}</math>; when S is used, <math>\Delta H = -1004 \text{ kg.-cal.}</math> Up to 1500°, the action with S is practically irreversible.</p> <p style="text-align: right;">Cyrus Feldman</p>

The system  $\text{BiCl}_3 + 3\text{Ag} \rightleftharpoons 3\text{AgCl} + \text{Bi}$ . T. I. Sokolova  
(N. S. Kurnakov Inst. Gen. Inorg. Chem., Acad. Sci. U.S.S.R., Moscow). *Izvest. Sektora Fiz.-Khim. Anal., Inst. Obshchei Neorg. Khim., Akad. Nauk S.S.S.R.* 21, 159-71 (1952).—This system was studied by thermal analysis and microstructure analysis. The diagonal cuts  $\text{AgCl-Bi}$  and  $\text{Bi-Cl}_3\text{-Ag}$  of the trapezoid part of the diagram show reaction products on both these lines; this indicates that the system is at least partly reversible. There was less interaction along the line  $\text{AgCl-Bi}$ ; this fact indicates that this is the more stable diagonal. The diagrams show the presence of 2 eutectics, one in the system  $\text{BiCl}_3\text{-BiCl-AgCl}$  and the other in  $\text{BiCl}_3\text{-AgCl-Bi}$ . The location of still another eutectic in  $\text{BiCl}_3\text{-BiCl-Ag}$  was hard to ascertain. On the diagram there is a large area of layer sepn. and 2 one-phase areas. Within the latter are the fields where  $\text{Bi}$ ,  $\text{BiCl}_3$ ,  $\text{Ag}$ ,  $\text{AgCl}$ , and  $\text{BiCl}_3$  sep. In the area of layer sepn. the following phases crystd.: (1)  $\text{Ag}$  in the lower layer and  $\text{AgCl}$  in the upper, (2) a eutectic alloy of  $\text{Bi}$  and  $\text{BiCl}_3$  in the lower and  $\text{BiCl}_3$  in the upper layer, and (3) a eutectic of  $\text{Bi}$  and  $\text{Ag}$  in the lower layer and  $\text{AgCl}$  in the upper. With a view of removal of  $\text{Bi}$  in  $\text{Pb}$  refining it is pointed out that the chlorides and the metals formed in this reaction combine very little in the molten state. The best yield of  $\text{Bi}$  is obtained with an excess of  $\text{BiCl}_3$  near the diagonal  $\text{AgCl-Bi}$ . The max. purity of  $\text{Bi}$  is 95 at. %. In the system  $\text{BiCl}_3\text{-Bi}$  was found an unstable compd.,  $\text{BiCl}$ , which decomposes into  $\text{Bi}$  and  $\text{BiCl}_3$ . M. Hirsch

The toxicity of the heat-insulating plastic prepared from urea and formaldehyde. V. V. Andreev and T. I. Sokolova. *Farmakol. i Toksikol.* 16, No. 4, 45-7 (1963). The heat-insulating plastic (I) prepd. from HCHO and urea (as a tar) is porous. I is prepd. in plates (sp. gr. 0.03) and crumbs, which break easily but do not burn. At 180-200°, I is carbonized and decompd. to form gases. A complete decompn. takes place at 400-500°. On an open flame the decompn. is quick and complete. Among the formed gases HCN is found, the presence of which was detected by absorbing the gases with a dil. alkali with the formation of Prussian blue. When 1 kg. of the plastic is burned 4.738 g. HCN is formed. Burning 0.15 g. plastic causes the death of mice after 1-2 min. (0.71 mg. HCN is produced). L. Goldenberg

PHASE I BOOK EXPLOITATION

SOV/6333

Bochkarev, V. V., ed.

Tekhnika izmereniye radioaktivnykh preparatov; sbornik statey (Techniques for the Measurement of Radioactive Preparations; Collection of Articles) Moscow, Gosatomizdat, 1962. 4600 copies printed.

Eds.: A. M. Smirnova and M. A. Smirnov; Tech. Ed.: S. M. Popova.

PURPOSE: This book is intended for specialists in nuclear instrumentation.

COVERAGE: The book is a collection of articles on recent developments in 1) measurement of the activity and 2) analysis of the composition of emissions of radioactive preparations. The methodology and apparatus used in these studies are described in detail. References are given at the end of each article.

TITLE: Sorption effects in measuring the radioactivity of gases

PERIODICAL: Izmeritel'naya tekhnika, no.2, 1963, 57-59

TEXT: In measuring the radioactivity of gases with gas-filled radiation counters, the absorption of  $\beta$ -radiation by the walls and end-effects cause errors which have both been thoroughly discussed, particularly in the non-Soviet literature. However, there are also two sorption effects: some of the material becomes firmly attached to the walls and remains there after the chamber has been nominally swept free; and some becomes temporarily attached to the walls during measurements, so disturbing them, but is afterwards released and swept out, so that the effect cannot be directly observed. Tests were made to determine the relative importances of these effects. A chamber, filled with a gas tagged with a source of  $\beta$ -radiation, has a thin mica window in one end over which is placed an end counter. The chamber also contains a layer of material of such a thickness as to absorb  $\beta$ -particles of maximum energy.

Card 1/3

Sorption effects in measuring the ...

S/115/63/000/002/008/008  
E194/E155

Then if this layer is placed next to the window without breaking vacuum, the counter records only  $\beta$ -particles from substances attached to the inner surface of the mica and to the surface of the layer. It can be confirmed that radiation originating in the gas filling of the chamber is not being counted by withdrawing the layer and inserting an analogous layer between the mica window and the counter. This gives the background level. After sweeping the chamber, the background contamination due to irreversible sorption can be determined. The actual experimental chamber, made of duralumin, was 178 mm long and 50 mm diameter with a window of 1 cm<sup>2</sup>. A disk with 12 positions could be placed at various distances in front of the window so that the material of the layer could be altered without breaking vacuum or changing the gas. The gas used was CS<sub>2</sub> tagged with S<sup>35</sup> with a specific activity of 25 milliCurie per gram of liquid carbon disulphide. Surface sorption was studied on the following materials: teflon, mica, special lubricant for CS<sub>2</sub>, brass, aluminium, methylmethacrylate, polished and unpolished ebonite, rubber mastic and sheet vacuum-rubber. The experimental procedures are described in some detail. The materials were found to fall into two groups: the first

Card 2/3

Sorption effects in measuring the ... S/115/63/000/002/008/008  
E194/E155

instantaneously acquire a certain surface activity which then increases exponentially with time (PVC, ebonite, methylmethacrylate). The other group includes the remaining materials except the rubber mastic, in which surface activity instantaneously reaches a certain value which then remains constant. The relative sorptions of samples of the different substances, i.e. the percentage of the radioactivity picked up by 1 cm<sup>2</sup> of the given surface to the activity of 1 cm<sup>3</sup> of the chamber was: teflon 5; mica 5; brass 6.5; aluminium foil 6.5; methylmethacrylate 13; PVC 28; polished ebonite 30; rubber mastic 39; rubber 45; unpolished ebonite 65. For materials of the first group the calculation is made for an exposure time of 26 hours. From these data it is possible to assess the sorption of CS<sub>2</sub> in particular experimental equipment. Thus the activity of CS<sub>2</sub> sorbed on the walls of the measuring chamber filled with radioactive carbon disulphide was directly measured. A large proportion of the sorption was reversible and so is not revealed by background measurements after cleaning. The sorption effects are very considerable, and differ for different materials. There are 4 figures.

TITLE: Measurements of activity of radioactive gases by means of spherical  
ionization chamber

SOURCE: Atomnaya energiya, v. 21, no. 2, 1966, 141-142

TOPIC TAGS: ionization chamber, radioactivity measurement

ABSTRACT: A spherical, 24-cm ionization chamber with a copper barrier, filled with air under atmospheric pressure and operating in the  $\alpha$ -spectrum energy range (0.15 to 2.20 Mev) was used for measuring the gas activity in experiments with  $^{133}\text{Xe}$ ,  $\text{CO}_2$  (labeled with  $^{14}\text{C}$ ),  $^{131}\text{Xe}$ ,  $^{85}\text{Kr}$ , and  $^{41}\text{Ar}$  gases. The gas activity was determined by means of compensation counters. The order of error was about 2.5%. The results showed that only  $^{14}\text{C}$ ,  $^{85}\text{Kr}$ , and  $^{41}\text{Ar}$  with simple spectra could be used, while  $^{133}\text{Xe}$  and  $^{131}\text{Xe}$ , with their conversion electrons, could not be used. The average current magnitudes  $K$  per particle in the chamber were correlated with the theoretical values and the results agreed within 25 to 30%. Orig. art. has: 1 figure and 1 table. [NA]

"Study of Morphological Changes in Adrenal Cortex of Rats Subjected  
to Thyroidectomy Under Influence of an Acute Trauma."

Prague, Ceskoslovenska Fysiologie, Vol 15, No 2, Feb 66, p 100

Abstract: 10 days after thyroidectomy, animals subjected to an acute  
acute trauma show changes in adrenal cortex when compared to  
normal animals; the content of corticosterone in the plasma is  
reduced. Changes in the distribution of fat in the adrenal  
glands between the animals that underwent the operation and con-  
trol animals are described. These differences may be due to the  
suppression of the adrenocorticotrophic function of the anterior  
lobe of the hypophysis due to the changed thyrotropic reaction  
after thyroidectomy. No references. Submitted at "16 Days of  
Physiology" at Kosice, 29 Sep 65.

SOURCE: Izobreteniya, promyshlennyye obraztsy, tovarnyye znaki, no. 21, 1966 32

TOPIC TAGS: acrylonitrile, chemical synthesis, catalyst preparation, *catalysis*

ABSTRACT: An Author Certificate has been issued for a preparative method for a catalyst for the synthesis of acrylonitrile by oxidative ammonolysis of propylene. A carrier with improved strength and heat resistance is prepared by molding, drying and heating to 1200—1250 a mixture of Kaolin and  $\alpha$ -alumina. The carrier is subsequently impregnated with bismuth, molybdenum, and phosphorus compounds. [B0]

TITLE: Gas-liquid coexistence curve for sulfur hexafluoride near its critical point

SOURCE: Zhurnal eksperimental'noy i teoreticheskoy fiziki. / Pis'ma v redaktsiyu. Prilozheniye, v. 4, no. 10, 1966, 409-413

TOPIC TAGS: critical point, critical pressure, phase transition, sulfur compound, fluoride, phase diagram

ABSTRACT: In connection with numerous recent attempts to determine the shape of the coexistence curve near the critical point, the authors obtained exact data on the gas-liquid equilibrium of specially purified (99.995% or better)  $\text{SF}_6$  in the temperature interval  $T_{cr} - T \approx 0.001 - 0.800^\circ\text{C}$ . The investigations were made with previously-described apparatus (Zh. Fiz. khimii v. 40, 264, 1966), which was improved to increase the experimental accuracy. The absolute temperature, the temperature of the vanishing of one of the phases, the volume, and the critical molar volume were measured accurate to  $0.002^\circ\text{C}$ ,  $0.002^\circ\text{C}$ ,  $\pm 0.05\%$  and  $\pm 0.2\%$  respectively. The value obtained by the authors for the critical temperature, pressure, and molar volume are  $45.560 \pm 0.005$ ,  $38.328 \pm 0.005$ , and  $198.0 \pm 0.4$ , respectively. The results show that the coexistence curve of  $\text{SF}_6$  is given in the interval  $T_{cr} - T \approx 0.000 - 0.050^\circ\text{C}$  by the equation  $T - T_{cr} = \alpha(v - v_{cr})$ . On going beyond  $0.050^\circ\text{C}$  from the critical point, the curve

changes smoothly to form  $T - T_{cr} = \beta(v - v_{cr})^3$ , and retains this form up to  $T_{cr} - T \approx 0.5C$ . It is concluded that to obtain a single equation for the coexistence curve near the critical point it is necessary to take into account higher terms in the series of the function  $(\partial p / \partial v)_T$ , a task beyond the scope of this investigation. The authors thank I. R. Krichevskiy and G. D. Yefremova for interest and advice. Orig. art. has: 2 figures and 1 table.

TITLE: Initiation of vinyl polymerization by organomercury compounds

PERIODICAL: Vysokomolekulyarnyye soyedineniya, v. 4, no. 3, 1962, 371-375

TEXT: On the basis of M. M. Koton's investigations (Dokl. AN SSSR, 88, 991, 1953) the effect of oxygen on the polymerization of methyl methacrylate (I) and acrylonitrile is studied at 30-50°C in the presence of dicyclohexyl mercury (II), diisopropyl mercury (III), diethyl mercury (IV) and diphenyl mercury (V), cyclohexyl mercury chloride (VI) and phenyl mercury chloride (VII). The polymerization rate increases with the temperature. The compounds do not dissociate at 30 and 50°C. II and III decompose rapidly at room temperature in the presence of small oxygen amounts. Unstable peroxide compounds which initiate the polymerization, are formed from oxygen and II and III. With stable V and mercury chlorides, oxygen has an inhibiting effect. Its increase first accelerates then decelerates polymerization owing to the decomposition of organometallic

compounds and to the inhibiting effect of oxygen. Increase in oxygen pressure reduces the molecular weight to a constant value. Maximum conversion corresponds to constant minimum molecular weight and probably also to a maximum content of radicals formed.  $r_1 = 0.8$ ,  $r_2 = 0.9$  holds for 6 hrs copolymerization of styrene and I at 50°C initiated by 0.3 mole% of II, and in 14 hrs copolymerization of acrylonitrile and I at 30°C initiated by 0.3 mole% of III. Since these relative activities are similar to those of free radical copolymerization, II and III cause free radical polymerization. In the absence of  $O_2$ , hydroquinone additions of 50-500 mole% of the initiator reduced the conversion degree of I from 12 to 2-5%, and the molecular weight from 1,500,000 to 300,000. An induction period of 5.5 hrs was found in the polymerization with IV in air. There are 3 figures and 4 tables. The most important reference to English-language publications reads as follows: F. M. Lewis, F. R. Mayo, W. F. Hulse, J. Amer. Chem. Soc., 67, 1701, 1945. X

AUTHOR: Sokolova, V. A.

TITLE: Precise positions of asteroids according to photographic observations at the Cape Observatory

PERIODICAL: Referativnyy zhurnal, Astronomiya i Geodeziya, no. 2, 1962, 18, abstract 2A173 ("Tr. Gl. astron. observ v Pulkove", 1961, v. 73, 147-155, English summary)

TEXT: The author presents the results of processing [2, 3] (1950, 0), 0-C] of photographic observations of asteroids. The observations were carried out at the Cape of Good Hope Observatory during 1956 - 1957 with a wide-angle camera of the Victoria triple refractor and Ilford Zenith plates (16 x 16 cm, scale 102"354 in 1 mm). The following asteroids were observed: 1, 2, 3, 4, 6, 7, 18, 40. The list of fundamental stars and "relationships" is given. ✓
